zagovor: oktober 2005

Povzetek

V vsaki državi se oblikuje sistem inštitucij, ki s svojimi aktivnostmi in vplivom delovanja zagotavlja izvajanje vseh nalog vodnega gospodarstva. Področje delovanja teh inštitucij sega od državnega nivoja upravljanja pa vse do lokalnega nivoja. Za pravilno delovanje sistema morajo biti naloge inštitucij pravilno razporejene med posamezne nivoje in po posameznih aktivnostih. Tako je vsaka država skozi zgodovino oblikovala svojevrsten sistem vodnega gospodarstva, ki ima svoje prednosti in slabosti. Diplomaska naloga prikazuje pregled organiziranosti za izvajanje vodnogospodarske javne službe v tujini in doma. Pri pregledu tujih držav je narejen podroben pregled Nemčije in Nizozemske in njenih ureditev vodooskrbnega sistema. Pregled se ne omejuje samo na javne službe, ampak zavzema celoten pregled organiziranosti vodnega gospodarstva in pregled zakonodajnih podlag. Primerjane so različne možnosti nivojskega upravljanja vodooskrbe v Sloveniji. Analiza se dotika tudi vloge javnih in zasebnih subjektov pri izvajanju javnih storitev s poudarkom na vodooskrbi.

Ključne besede: vodno gospodarstvo, inštitucije, vodooskrba, ekonomske javne službe

Abstract

Each state has a formed institutional system which, with its activities and action influence, ensures the execution of all tasks of water management. These institutions reach from the state level management to the local level. For a regular functioning of the system the institutions' tasks should be regularly arranged to individual levels and by individual activities. Thus each state, through the history, formed its unique system of water management, which includes advantages as well as disadvantages. The final paper represents a review of organization of the execution of water management public services at home and abroad. In examining foreign countries, a detailed survey of Germany and the Netherlands and their water supply system arrangement is carried out. The survey is not limited only to public services but includes the entire review of water management organization and the examination of the legislative basis. Various possibilities of level water supply management in Slovenia are compared. The analysis deals also with the role of the public and private subjects in the execution of public services with the emphasis on water supply.

Key words: water management, institutions, water supply, economic public services
